About Me

Machine Learning Engineer with **2+ years of experience** building and deploying ML solutions within a **SaaS security and compliance platform**. Specialized in **orphaned account detection**, risk mitigation, and cost optimization using scalable ML pipelines and cloud-native technologies. Strong expertise in **Python, PyTorch, feature engineering, MLOps, and AWS**, with a proven ability to translate business problems into production-grade ML systems.

Work Experience

Greet Labs, Bangalore

MACHINE LEARNING ENGINEER

Dec. 2022 - Present

- Designed and deployed ML models to identify orphaned accounts, significantly reducing security risks, licensing costs, and compliance gaps across SaaS ecosystems.
- Built end-to-end ML pipelines using Airflow for data ingestion, feature generation, model training, and scheduled inference.
- Implemented feature stores (Feast) to ensure consistency between training and production data.
- Leveraged graph databases (Neo4j) to model complex identity relationships and uncover hidden access patterns.
- Developed scalable real-time and batch processing pipelines using Kafka and PostgreSQL.
- Applied SHAP-based explainability to improve model transparency and build trust with security and compliance stakeholders.
- Deployed models on AWS, integrating CI/CD pipelines for automated testing, versioning, and deployment.
- Collaborated with product, security, and engineering teams to align ML outputs with business KPIs and compliance requirements.
- Tools and Technologies used: Airflow, PyTorch, Feast, Neo4j, Kafka, Postgres, SHAP, AWS, CI/CD.

IMPACT

- Improved orphaned account detection accuracy and reduced false positives.
- Enabled faster deactivation workflows, lowering exposure to unauthorized access.
- Contributed to measurable cost savings through license optimization.

Greet Labs, Bangalore

PYTHON DEVELOPER

Jun. 2021 - Aug. 2023

- Proficiently harnessed the power of the Pandas library to extract, clean, and manipulate pharmaceutical data. This process involved several crucial steps to ensure the accuracy and reliability of the information we worked with.
- Undertook the challenge of building sophisticated machine learning models to predict the risk compliance of patients. This involved a comprehensive and systematic approach that incorporated various stages of model development and validation.
- Translating legacy code from SAS to Python involves converting existing code written in the SAS programming language into Python code. This process requires a thorough understanding of both programming languages, data processing concepts, and the specific logic embedded in the legacy SAS code.
- Collaborated with Product Managers, Design, and Customer Support teams to proactively deliver features and address customer pain points.
- Tools and Technologies used: Python, MySQL, Pandas, Flask.

Projects

The Complete SaaS Management Platform

IDENTIFY ORPHANED ACCOUNTS

Python, PyTorch

- Orphaned Account Risk Scoring System:** Developed a risk scoring model using behavioral and access metadata to prioritize account deactivation.
- Graph-Based Identity Analysis:** Built Neo4j-based pipelines to detect anomalous access relationships across SaaS tools.

RECOMMENDER-ENGINE

Python, Flask

- Developed a Recommender-Engine, **based on Machine Learning Model**, recommend movies based on likes.
- Implemented Machine Learning Model at Web app.

Skills

LANGUAGES	Python 3.10.5+(Proficient), Javascript
FRAMEWORKS	PyTorch, TensorFlow, Next.js
DATA SCIENCE	NumPy, Pandas, Scikit-learn, Matplotlib.
TOOLS	Git, Jira, Agile

Education

A.M.C. Engineering College, Bangalore

MASTER OF COMPUTER APPLICATIONS

Karnataka, India

- Class : First Class

Administrative Management College, Bangalore

BACHELOR OF COMPUTER APPLICATIONS

Karnataka, India
